Blasthole diameter (D): Generally, the cost of drilling and blasting decreases as hole diameter increases. The relation between blasthole diameter and face height is approximately: $D = 0.001 \text{ to } 0.02 H$ Burden (B) : This is the distance in metres from a blasthole to the nearest free face and has the following approximate relation: $B = 25D \text{ to } 40D$

Rock Volume in Construction blasting is based on bank cubic yards. This is rock in place. In blasting, you must drill deeper then needed to facilitate breaking the rock to grade. this extra drilling is called subdrill. Many contractors will try and charge for this. So, accepted practice is (length x width x cut depth)/27. In regards to overburden.

may represent as much as 80 percent of the total drilling and blasting costs, mainly because of utilization of the lower cost explosive. By contrast, in the northeastern United States, hard rock formations exist in a relatively wet environment, where the explosives costs can be as much as 70 percent of the total drilling and blasting expense.

Chapter 8 BLAST DESIGN

Drilling and blasting is the controlled use of explosives and other methods such as gas pressure blasting pyrotechnics, to break rock for excavation.It is practiced most often in mining, quarrying and civil engineering such as dam, tunnel or road construction.The result of rock blasting is often known as a rock cut.. Drilling and blasting currently utilizes many different varieties of ...

Drilling and blasting - Wikipedia

Drilling and blasting can be considered as a system that consists of three different subsystems, including technical parameters like burden, spacing, depth, bit or drill hole diameter, penetration rate, explosive mass, etc. ;economic parameters such as bit cost, hourly drilling costs, drilling and blasting operational costs as well as environmental parameters, for example, emissions of NOx, CO and SO x.

The most serious problem with this type of blasting is borehole accuracy. Key holes are usually diamond drilled or drilled with a Boart drill. If the boreholes are inaccurate, freezing of the muck can occur with re-drilling by remote as the only remedy for re-blasting. The calculation of void space can be expressed by the following equation;
